The sequence contained an oligo-dT track that was present in the oligonucleotide that was used to prime the synthesis of first strand cDNA and therefore this may represent a bonafide poly A tail. cDNA Library Preparation: M.B. Soares Lab Clone distribution: clones will be available through Research Genetics (www.resgen.com)
The following repetitive elements were found in this cDNA sequence: 73-206, >RSIME1#SINE/B4(B5)

//clone_lb="TgRH Tachyzoite Swere grown in human
Toxoplasma RH strain tachyzoites were grown in human
foreskin fibroblast cultures in vitro. The library was
constructed by K.L. Wan, Cambridge University. cDNAs were
synthesized from polyA RNAs by oligo d(T) priming and
directionally cloned into the EcoRI to XhoI sites of the
Lambda ZapII vector using the ZAP-cDNA synthesis kit
(Stratagene). WARNING: the library contains a small
gercentage of cDNAs derived from the human host cells."

```

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

sequence, see http://genome.wustl.edu/gsc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 6 (bases 1 to 22842) Waterston, R.
                                                                                                                                                                                                                                                                                                                                                                                                                          The clone sequenced to the left is RP11-401C13, 2000 bp overlap; the clone sequenced to the right is RP11-574017, 2000 bp overlap. Actual end of this clone is at base position 48999 of RP11-574017.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  NOTICE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Waterston, R.H.

regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one Mi3 subclone; and the assembly was confirmed by restriction digest, except on the rare occasion of the clone being a YAC.

The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:
Em: RMBL; Sw: SWISSPROT; Tr:, TREMBL; Wp:, WORMPEP; Information on the WORMPEP database can be found at http://www.sanger.ac.uk/Projects/C elegans/wormpep Repeat names beginning 'Dr' were identified by the Recon repeat discovery system (Zhirong Bao and Sean Eddy, submitted), and those beginning 'drr' were identified by Rick Waterman (Stephen Johnson lab, WashU). Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        NOTE: This is a 'working draft' sequence. It currently consists of 8 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        56570

The method may be used for genotyping an CC alpha2B, alpha2A or alpha2C receptor gene and further used to determine CC whether an individual is at increased risk of developing a disease CC disease, central nervous system disease selected from cardiovascular (CC organized with alpha2B, alpha2A or alpha2, comprising detecting a colymorphic site which correlate to disease selected from cardiovascular (CC organized combinations of these) or antigonist (e.g. epinephrine, conceptinephrine, clonidine, oxymetazoline, guanabenz, UR14304, BHT933 and (CC organized combinations of these) or antigonist (e.g. pohimbine, prazosin, ARC 239, crauwolscine, idazoxan, tolazoline, phentolamine and combinations of these) by detecting the polymorphic site and correlated to adenylyl (CC cyclase, Max kinase activity, phosphorylation or inositol phosphate (CC levels). The present sequence is that of a human alpha-2BAR PCR primer, CC useful for the genotyping methods of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is a gene encoding human alpha2B-adrenoceptor (alpha2B-AR) variant protein. Alpha2B-AR has a glutamic acid repeat element (amino acids 298-309) of 12 glutamates, in an acidic stretch of 18 amino acids (amino acids 294-311), located in the third intracellular loop of the receptor polypeptide. The variant is obtained by deletion of three glutamates from the Glu repeat (amino acids 307-309). Alpha2B-AR gene is located on chromosome 2. Alpha2-AR mediate many of the physiological effects of the catecholamines, norepinephrine and epinephrine. An antagonist of alpha2B-adrenoceptor is useful for treating a mammal suffering from vascular contraction of coronary arteries and a disease involving vascular contraction of coronary arteries which is clinically expressed as coronary heat disease (CHD), unstable chromic angina pectoris which is clinically expressed as Prinzmetal's variant form or acute myocardial infarction (AMI). Alpha2B-AR gene is used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Snapir A,

                                                                                                                                                                                                                                        밁
                                                                                                                                                                                                                                                                   Ş
                                                                                                                                                                                                                                                                                                                                                                           The invention relates to genotyping an alpha-2B, 2A, or 2C adrenergic CC receptor gene (1) (III) by detecting a polymorphic site, comprising; CC (a) obtaining a sample having a polymorphic site, comprising; CC alpha2A or alpha2C or fragment or complement of; and CC (b) detecting a polymorphic site comprising nucleotide encoding an alpha-2B, CC (i) a site comprising (A) (yytosine or guanine at position 753 of (IIV) CC or a site comprising (Yotosine or guanine at position 753 of (IIV) CC or a site comprising (III). The method may be used for genotyping an CC alpha2B, alpha2A or alpha2C receptor gene and further used to determine CC whether an individual is at increased risk of developing a disease associated with alpha2B, alpha2A or alpha2, comprising detecting a CC polymorphic site which correlate to disease selected from cardiovascular CC disease, central nervous system disease and combinations of these. In addition, the technique may be used to predict an individual's response CC to an alpha2B, alpha2A, or alpha2C agonist (e.g. epihephrine, CC norepinephrine, clonidine, oxymetazoline, younabenz, UK143104, BHT933 and CC combinations of these) or antagonist (e.g. yohimbine, prazosin, ARC 239, rauwolscine, idazoxan, tolazoline, phentolamine and combinations of these) by detecting the polymorphic site and correlating the site to a predetermined response (where the response is correlated to adenylyl C cyclase, MAP kinase activity, phosphorylation or inssitol phosphate CC (Alays)905).

CC (Alays)905).
                                                                                                                                                                                                                                                                                                        Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      alpha-2B-adrenoceptor variant DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a method for detecting a risk of hypertension by determining the pattern of alleles encoding a variant alpha-2B-adrenoceptor (AR) protein. The methods and compositions of the invention are useful for detecting risks and targeting treatment for hypertension. The kit is also useful for selecting for clinical drug trials testing the anthypertensive effect of compounds. The present sequence is human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Disclosure; Page 24-26; 35pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is a gene encoding human alpha2B-adrenoceptor (alpha2B-AR) protein. Alpha2B-AR has a glutamic acid repeat element (amino acids 298-309) of 12 glutamates, in an acidic stretch of 18 amino acids (amino acids 294-311), located in the third intracellular loop of the receptor polypeptide. Alpha2B-AR gene is located on chromosome 2. Alpha2-AR mediate many of the physiological effects of the catecholamines, norepinephrine and epinephrine. An antagonist of eatherholamines norepinephrine and epinephrine. An antagonist of vascular contraction of coronary arteries and a disease involving vascular contraction of coronary arteries which is clinically expressed as coronary heat disease (CHD), unstable chronic angina pectoris which is clinically expressed as Prinzmetal's variant form or acute myocardial infarction (AMI). Alpha2B-AR gene is used in gene therapy.
                                                                                                                                                                                                                                                 18-FEB-2002

CC The invention relates to genotyping an alpha-2B, 2A, or 2C adrenergic CC (a) obtaining a sample having a polymorphic site, comprising; CC (a) obtaining a sample having a polymorphic site, comprising; CC (b) detecting a polymorphic site complement of; and (b) detecting a polymorphic site comprising nucleotide positions 901-909 (c) of (I), a site comprising cytosine or guanine at position 753 of (IIV) (c) positions 961-972 of (III). The method may be used for genotyping an explanata, alpha2A or alpha2A, or alpha2

                                                                                                                                                                                                                                                                                                                                      Query Match
                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a method for detecting a risk of hypertension by determining the pattern of alleles encoding a variant alpha-2B-adrenoceptor (AR) protein. The methods and compositions of the invention are useful for detecting risks and targeting treatment for hypertension. The kit is also useful for selecting for clinical drug trials testing.

                                                        The invention relates to a combination which, comprises a number of polynucleotide probes comprising a sequence selected from one of the 1490 sequences mentioned in the specification. The combination is useful as an array element in a microarray for monitoring the expression of a number of target polynucleotides. The microarray is particularly useful in the diagnosis and treatment of cancer and immunopathology and neuropathology. The microarray is useful in diagnostics and treatment regimens, drug
                                                                                                                                                                                                                                                                                                                                                                                                                                        Combination of polynucleotide probes, useful as array elements in microarray for monitoring the expression of a number of target

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  A genomic DNA clone (AAT5949) codes for human alpha-2B adrenergic receptor (AAW11804), a member of the rhodopsin-like signal transduce family. It was isolated from a human spleen genomic library in the lambda vector Charon 2B by screening with a 1.6 kb fragment of the human 5-hydroxytryptamine receptor gene. Plasmid pNGC-alpha-2B comprising DNA encoding the alpha-2B adrenoceptor is deposited as ATCC 68144. Vectors have been adapted to allow prodn. of alpha-2B adrenoceptor in bacterial, yeast or mammalian cells; transfected Ltk- cells, designated L-NGC-alpha-2B, are deposited as ATCC CRL 10275. Membranes of such cells can used in novel methods to identify drugs which specifically interact with, and bind to, the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   forensics and pharmacogenomics. The microarray is also useful for monitoring progression of diseases and for developing sophisticated profiles for the effects of currently available therapeutic drugs. The combination is also useful for purifying a subpopulation of mRNAs, cDNAs and genomic fragments and in research and diagnostic applications. The array can detect changes in expression in a large number of genes coding for different signaling pathway populations which can be used to diagnose various diseases including cancer e.g. adenocarcinoma and leukaemia, immunopathies e.g. AIDS and asthma, neuropathies e.g. Alzheimer's disease and Parkinson's disease. The present sequence represents a polynucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                            19-DEC-2000; 2000US-257144P
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              08-AUG-2002.

New isolated antigenic peptides e.g., for G (GPCR), useful for diagnosing and designing conditions in which GPCRs are involved, e.g.

protein-coupled receptors.
drugs for treating
 AIDS, Alzheimer's disease

disease

autoimmune diseases Fig 1; 523pp;

Disclosure;

invention describes antigenic peptides

(I)

comprising

English.

CC (a) any one of 1601 sequences (see ABP82019 to ABP83619) of 12-24 amino CC acids. Also described: (1) an assay for the detection of a particular CC G protein-coupled receptor (GPCR) or a candidate polypeptide in a sample; CC and (2) an isolated antibody having high specificity and high affinity or avidity for a particular GPCR. (1) can be used as GPCR modulators and in gene therapy. The antigenic peptides for GPCRs are useful in detecting CC antibody against a particular GPCR, and in the production of specific CC presence or absence of corresponding GPCRs. The antigenic peptides for CC GPCRs and antibodies are useful for disgnosing and designing drugs for CC regeneration-related diseases, growth-related designing drugs for CC gives and antibodies are useful for disgnosing and designing drugs for CC offices and antibodies are useful for disgnosing and designing drugs for CC elementation-related disease, immunological-related cell proliferative CC diseases, or autoimmune diseases, e.g. AIDS, Alzheimer's disease, call constantivitis, osteoporosis, cancer, cardiomyopathy, chronic and acute inflammation, allergise, Crohn's disease, disease, disease, disease, disease, parkinson's disease, multiple sclerosis, pain, psoriasis, cancery, depression, schizophrenia, dementia, mental retardation, memory constantive, depression, schizophrenia, dementia, mental retardation, memory constantive, candiomyopathy, chronic and acute constantive, pain, psoriasis, cancery, cardiomyopathy, chronic and acute constantive, depression, schizophrenia, dementia, mental retardation, memory charactery, depression, schizophrenia, cancer, cardiomyopathy, chronic and cute constantive, depression, schizophrenia, dementia, mental retardation, memory charactery, depression, schizophrenia, cancer, cardiomyopathy, chronic and cute constantive, depression, schizophrenia, charactery, and mental retardation, memory charactery, and memory

```
Comprising a sequence capable of hybridising under stringent conditions comprising a sequence selected from any one of 999 sequences (ABN99231), comprising an exequence selected from any one of 999 sequences (ABN99231), comprising an exequence selected from any one of 999 sequences (ABN99231), comprising an exequence sequence acid, is comprising an exequence sequence acid, is constituted by comprising an exequence sequence acid, is compressing an exequence sequence acid, is compressing an exequence sequence acid, is compression or sequence acid, is compression or control of its encoded compositions that modulate the expression or function of its encoded compositions that modulate the expression or function of its encoded compositions that modulate the expression or function of its encoded compositions that modulate the expression or function of its encoded compositions that modulate the expression or function of its encoded compositions that modulate the expression of protein and in studying associated physicological pathways. (I) is also useful in secreening compositions that complete acid, is series. (II) and (III) are useful for screening of biologically active compositions of the screened agents are useful in improved methods of treating crops to prevent or treat disease. (II) are also useful in screening compositions to identify sents that mind or enhance the action of tolerance companies to dentify sents that mind or enhance the action of tolerance companies to dentify agents that mind or enhance the action of tolerance compositions of mutritional product in a particular plant, (III) is useful in improved methods of treating crops to plant. (III) is useful for identifying other mediators that enhance or induce collection of the collular metabolism and for screening compounds constituted that the collular metabolism and for screening compounds constituted and control of the period of the printed constitution, but was obtained in electronic format directly from USPTO constitution and toleration of the perio
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gorlach J,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABL018737-ABB72072).
                                                                                                                                                                                                                                                                                                                                                                                                                               The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from at ftp.wipo.int/pub/published_pct_sequences.

The clones were obtd. from a foetal lung library using a portion of the coding region of clone 13 (see also AAT48438) as probe. They show substantial variation in the 5' untranslated region but only minor differences in the coding region. Translated coding regions are given in AAW10666-73. While the variants may be important in e.g. transcriptional reglation they are untranslated and hence cannot affect bioactivity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     09-FEB-1996;

                                                                                                                                                                                                                                                         cDNA clones b2, h1, u2, f1, a1, b1, d2 and dd2 (AAT48442-49) are variants of clone 13 (AAT48438), which codes for pCL13 (AAW10662), a novel TGF-beta-like cytokine whose activities include immunosuppression, down-regulation of leucocyte extravasation and motility, promotion of cell differentiation and inhibition of proliferation. The clones were obtd. from a foetal lung library using a portion of the coding region of clone 13 (see also AAT48438) as probe. They show substantial variation in the 5 untranslated region but only minor differences in the coding region. Translated coding regions are given in AAW10666-73. While the variants may be important in e.g. transcriptional reglation they are untranslated and hence cannot affect bioactivity.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Score
